EDUCATION

Stanford University
Ph.D. Statistics, 2020 (advised by Susan Athey)

Dissertation: *Topics in Machine Learning and Causal Inference with Applications in Social Sciences*

Research focus:

- Machine learning methods to estimate heterogeneous treatment effects
- Clinical trial design and analysis under treatment spillover and missing data

University of Chicago
B.Sc. Mathematics, 2015

EXPERIENCE

- Experimentation
- Causal Inference
- Machine Learning
- Bayesian Methods
- Privacy
- Python, R
- SQL

EXPERIENCE

Meta — Senior Research Scientist, Senior Software Engineer (Machine Learning)

Aug 2024 – Present

- Developed a novel estimation method for sequential treatments with carry-over effects, enabling valid online experimentation to evaluate ranking methods (CODE@MIT 2025).
- Trained and rolled out causal machine learning algorithms to predict uplift in targeted ad placement algorithms on Facebook.
- Built a Bayesian experimentation framework addressing overestimation bias; now used to evaluate hundreds of experiments per half (CODE@MIT 2025). Core developer of experiment analysis and scalable infrastructure in a centralized experimentation system.

LinkedIn — Senior Machine Learning Engineer

Jul 2020 – Jul 2024

- Developed a differential privacy framework for hypothesis testing across sensitive groups; introduced new statistical tests (NeurIPS Workshop on Algorithmic Fairness Through the Lens of Causality and Privacy; PMLR 2023).
- Created and productionized a fairness metric for A/B testing measuring representation shifts; monitoring hundreds of daily experiments (CODE@MIT 2022).
- Built tooling to detect heterogeneous treatment effects (HTEs) in large-scale experiments.

Nines AI — Statistical Consultant

Jan 2020 – May 2020

- Partnered with engineers and clinicians at a Series A healthcare startup to develop methods for machine learning and medical trial design.
